Stupid Ransomware is a family of ransomware infections that are typically utilized by less skilled developers and many utilize themes based on movies, pop-culture, or pretend to be law enforcement. This family of ransomware infections are created using an open source project that was posted to GitHub.

The good thing about this ransomware family is that they static encryption keys and thus are easy to decrypt. You can see an example of a Stupid Ransomware variant below.

YOUR COMPUTER HAVE BEEN LOCKED !

All your files have been blocked
by an undetectable virus!
The only way to decrypt your files
is to buy the keys unlock, if you do not pay,
all of your files will be blocked forever
and deleted after 24 hours
after the virus of opening ...
To buy the key, it is very simple
go to the website: Localbitcoins.com
Create an account, choose your payment method,
open a transaction and follow the instructions.
Do not take this virus for a joke, you can be fatal

TO UNLOCK THIS COMPUTER YOU ARE OBLIGED TO PAY 35€ **3 33 45**

Stupid Ransomware variant

[Michael Gillespie](#) has created a decryptor called StupidDecryptor that contains the decryption keys for all known Stupid Ransomware variants that were released. The currently supported variants are the ones that append the following extensions to the names of encrypted files.

bleepingcomputer

From a bleeping computer to a working computer

Instructions on how to use StupidDecryptor are below.

How to Decrypt Stupid Ransomware variants

To decrypt a Stupid Ransomware variant you can download the StupidDecryptor from the link below.

STUPIDDECRYPTOR

[DOWNLOAD NOW](#)

Once downloaded, simply double-click on the executable to start the decryptor and you will be greeted with the main screen.

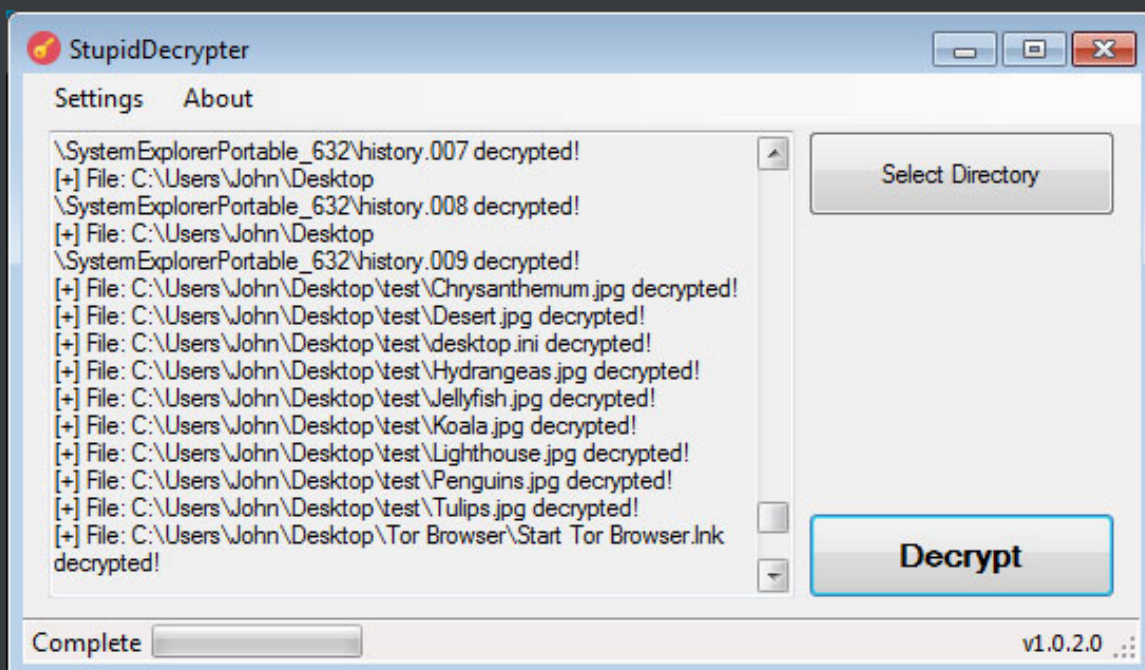

StupidDecryptor

Now click on the **Select Directory** button and select the drive you would like to decrypt, such as the C:\ drive. Once you select a drive, the Decrypt button will become available.

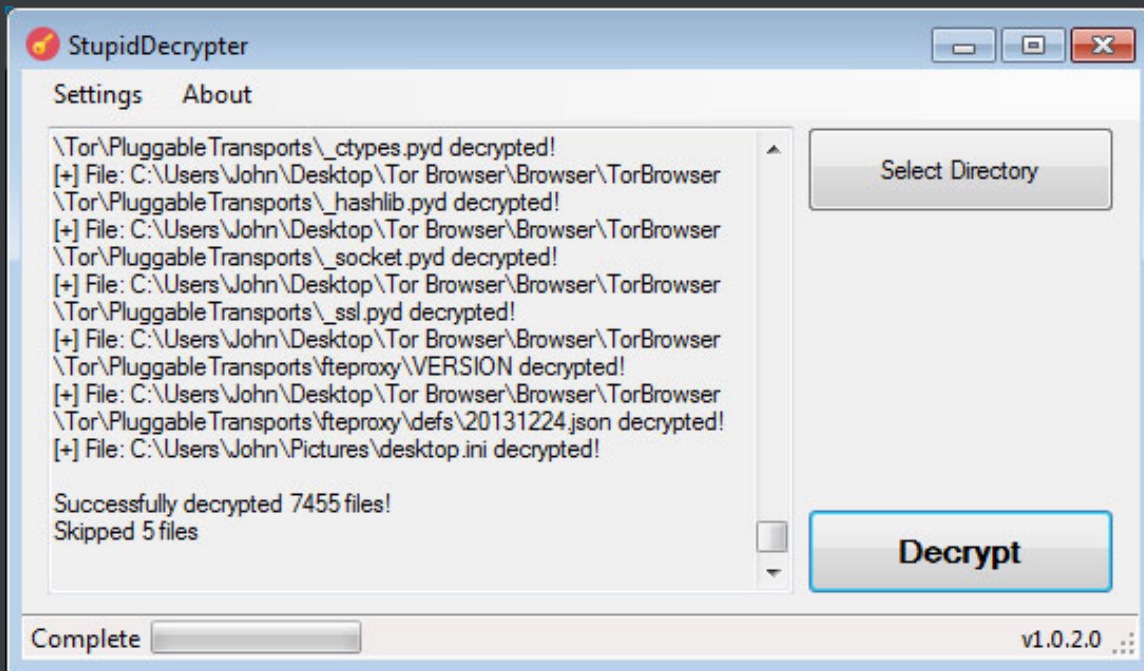

Now click on the **Decrypt** button to begin decrypting the selected folder. Once you click Decrypt, the program will decrypt all the encrypted files and display the decryption status in the window.

Decrypting Files

When it has finished, the decryptor will display a summary of the amount of files that have been decrypted. If some of the files were skipped it may be due to permissions configured on those files.

Decryption

Finished

Though your files are now decrypted, the original encrypted files will still be on your computer. Once you confirm that your files have been properly decrypted, you can use [CryptoSearch](#) to move all the encrypted files into one folder so you can delete or archive them.

You can now close the decryptor and use your computer as normal. If you need help using this decryptor, feel free to leave a comment.
